Linear algebra moves steadily to n vectors in m-dimensional space. We still want combinations of the columns (in the column space). We still get m equations to produce b (one for each row). Those equations may or may not have a solution. They always have a least-squares solution. The interplay of columns and rows is the heart of linear algebra.

### Linear Algebra and Its Applications (Fourth Edition)

• The fourth rule is correct if we define  $-x$  to be the inverse of the function  $f(\cdot)$ , because then the rule  $f(g(x)) = x$  states that  $f(f^{-1}(x)) = x$ , assuming an inverse of  $f$  exists. • The seventh rule is not true in general since  $c(x+y)$  is  $cf(g(x))$  and  $cx+cy$  is  $cf(g(x))$  which are not the same in general.

The fourth equation is  $x_4 = -5$ , and the other equations do not contain the variable  $x_4$ . The next two steps should be to use the variable  $x_3$  in the third equation to eliminate that variable from the first two equations. In matrix notation, that means to replace  $R_2$  by its sum with 3 times  $R_3$ , and then replace  $R_1$  by its sum with  $-5$  times  $R_3$ . 6.
